

COACH VENTILATORS

- These 3D prints represent the varying types of ventilators seen on coach roofs.
- The vents are mounted on a 0.75mm peg which also acts as a sprue for each individual vent.
- Cut the peg where it joins to the main base using a sharp blade or a pair of fine snips. Then trim the peg to the required length.
- Drill a hole in your coach roof and glue the vent in using your preferred adhesive. Cyanoacrylate or epoxy glues are both suitable.
- The vents can be painted at the same time as your roof in your preferred method. Take care not to overpaint the vents as this will obscure the fine detail in the prints.
